

✦ CHANGE REPORT · v0.2.0

Manual Apply Flow + Claude Cost Dashboard

Confirm-gated job applications, per-job document generation, and an owner-facing Claude API cost dashboard with live tracking and bill reconciliation.

NEW FEATURES

Branch `feat/claude-cost-dashboard-and-apply-flow` · 2026-06-25 · JobPilot

1 • Overview

Two workstreams shipped this update. The application no longer auto-fills the Applied tab — a job is "applied" **only** after the user clicks Apply and confirms. Separately, a new admin dashboard makes Claude API spend visible, attributable, and reconcilable against the real bill.

WORKSTREAM A

Apply Flow

Manual, confirm-gated. Per-job docs. Inline ingestion.

WORKSTREAM B

Cost Dashboard

Live tracking, measured factors, margin, reconciliation.

SCHEMA COLUMNS

+1

The core bug it fixes

Before:

every shortlisted job appeared under *Applied* even though the user never applied — the pipeline created application rows during ingestion and the Applied page showed all of them.

After:

`appliedAt` is the single source of truth. Applied = only jobs the user clicked Apply on and confirmed. Pipeline-prepared apps (`appliedAt = null`) never appear.

2 · Apply flow — before vs after

BEFORE

- 1 Click **Start a Run** → redirected to `/runs`
- 2 Pipeline auto-creates applications during ingestion
- 3 All apps appear in **Applied** — no user intent

AFTER

- 1 **Apply** button on each Jobs Found card
- 2 Popup — add extension (every 10th)
- 3 Popup — **generate documents** for this job
- 4 Docs ready — **Download** + **Continue**
- 5 Opens posting → apply on the site
- 6 Return → **"Did you apply?"** → Yes → **APPLIED**

Data flow — a job "moves" to Applied

Dedup + reuse:

apply is idempotent per job — re-applying returns the same application and reuses already-generated documents instead of regenerating.

3 · Inline ingestion & Jobs Found

Ingestion folded onto the dashboard — `/runs` deleted

- **Start a Run** triggers ingestion inline. Subscriber → runs now; non-subscriber → popup (Subscribe → billing, or run a test).
- Live **ActiveRunBanner** — stage progress (Discovering → Parsing → Scoring → Done) + live found / added / duplicate counts.
- Run history moved onto the dashboard; `/runs` route redirects to `/dashboard`.

Jobs Found improvements

- **Sort:** Newest fetched · Oldest fetched · Best match.
- **"Fetched X ago"** per card (from `matchedAt`), alongside "Posted X ago".
- Live re-fetch every 3 s while a run is active — jobs stream in.

4 · Per-job document generation

Latency fixed without quality loss.

The three AI calls (resume on Claude, cover letter + cold email on local) ran **sequentially**

(~65 s). Now run

concurrently

(~35–40 s ≈ the Claude resume call alone). Identical prompts and models.

- Pipeline no longer bulk-generates docs — only shortlists. Generation happens per-job on apply. Gated by `PIPELINE_AUTOGEN_DOCS` (default off).
- Regenerating no longer creates duplicate document rows (delete-before-insert per type).

5 · Admin "Claude API Cost" dashboard

New page `/claude-usage` — Claude clay-orange theme, **live (auto-refresh 10 s)**. Backed by `GET /api/admin/claude-usage`.

The headline insight

A Claude resume loses money on every plan.
Cost ≈ \$0.092/resume vs revenue/app: Starter −\$0.044 · Pro −\$0.033 · Max −\$0.026. Only profitable *blended* because ~86% of resumes fall back to the free local model.

Claude routing		14%
Local (free)		86%

6 • Measured cost factors

New column `AIUsageEvent.breakdownJson` records each call's **actual** token split (sized by real content, apportioned to billed totals) — replacing the earlier modeled estimate. Clickable Input/Output bars drill into these.

Input cost factors

ATS skill prompt		99%
Base resume		0.6%
Job description		0.4%

Output cost factors

ATS analysis		66%
Experience		17%
Technical skills		8%
Summary		6%

Actionable:

the ATS skill prompt dominates input → enabling prompt caching is the biggest win. The ATS analysis dominates output → dropping it (if unused) cuts ~2/3 of output cost.

7 • Bill reconciliation

The app only sees its own API key; Anthropic's bill includes others. `POST /api/admin/claude-usage/reconcile` imports the billing CSV and prices every row (incl. cache multipliers).

Tracked (app key)
\$2.38

+

resume-parsing key
\$0.25

=

Billed (Anthropic)
\$2.62

Verified: CSV total \$2.6223 matches the Anthropic console exactly. The \$0.25 gap is the separate "resume parsing" key the app never tracked.
